

# Exercise 4 - Keyboard Key Press Display

## 🔗 Objective:

Write a JavaScript program that captures a user's key press and displays the pressed key in a designated HTML element. You will be provided with the HTML file, and your task is to write the necessary JavaScript code.

## HTML File:

You will be given an HTML file with the following structure:

- A `div` element with an ID of `"keyDisplay"` where the pressed key should be displayed.

## JavaScript Instructions:

1. **Add Keydown Event Listener:** Attach an event listener for the `keydown` event to capture the key that the user presses.
2. **Display the Pressed Key:** Update the content of the HTML element with ID `"keyDisplay"` to show the pressed key. If the user presses the space key, display the text `"Space"`.

## Constraints:

- Do not modify the HTML file.
- You must use the `addEventListener` method to attach the keydown event listener.
